

How it works

- **After installation, System Recovery** scans your computer to identify files that need to be backed up. These selected files then form what is called your "backup set." System Recovery then sends your backup set over the internet to our data centers where they are stored safely and securely.
- **Common-File Elimination.** This smart technology is applied to your "backup set" to identify files already stored at the data center. These files remain in your "backup set" but never need to be re-sent unless they change. This greatly reduces data sending times.
- **Block Differential Technology** is also applied to files in your "backup set." This technology determines the exact portions of a file that have changed. Only the changed portions need to be transmitted to the data center. Again, greater efficiency.
- **Compression, or shrinking of your** backup data, is then applied before your backup set is sent to the data center. This further optimizes internet transmission time, and uses less data storage space.
- **Advanced AES encryption** converts your compressed "backup set" to an unreadable, completely safe format for transmission and storage over the internet.
- **Transmission**, the final step, sends your optimized "backup set" to the secure System Recovery data center servers.

Free Trial

SystemRecovery.com offers a free 15-day trial of online backup. This is a risk-free, fully functional version of our online backup service, and no credit card is required!

What is System Recovery?

System Recovery is a secure automatic remote backup service that works on any Windows computer. It's simple to install and use. No expensive extra equipment is needed, and the whole backup process is automatic. Just set it and forget about it. System Recovery is extremely reliable; it's built on the world's No. 1 solution for protecting data on PCs.

**It's Automatic!
Just Set It and
Forget It**

**It's Smart!
With Block
Differential
Technology**

**It's Secure!
Advanced AES
128 Encryption**

We all have files we cannot lose...

**Peace of Mind starts at
just Pennies a Day**

System Recovery Features

- **Automatic Backup.** The backup process automatically starts whenever an internet connection is detected, or at your predetermined time. No more tedious backup chores! Backups can be performed nightly while you sleep. Manual backups are also fully supported.

- **Point-and-Click Restore** allows for simple, fast file recovery 24 hours a day, 365 days a year. Downtime in the event of virus, file corruption, sabotage or malware is minimal.

- **SystemRestore™ Technology** allows users to restore their system configuration to any date in the past 45 days. Available when you perform a full system backup, your machine can be restored to the exact same look-and-feel prior to a disaster, complete with all applications and data.

- **Block Differential** file comparison saves only the changed portions of files rather than the entire file. This can reduce the average backup session from hours to minutes and allows far more efficient operation.

- **Backup Restart Technology.** You can stop or delay the backup process at any time if you need to. When resumed, the backup will continue to send any previously unsent files.

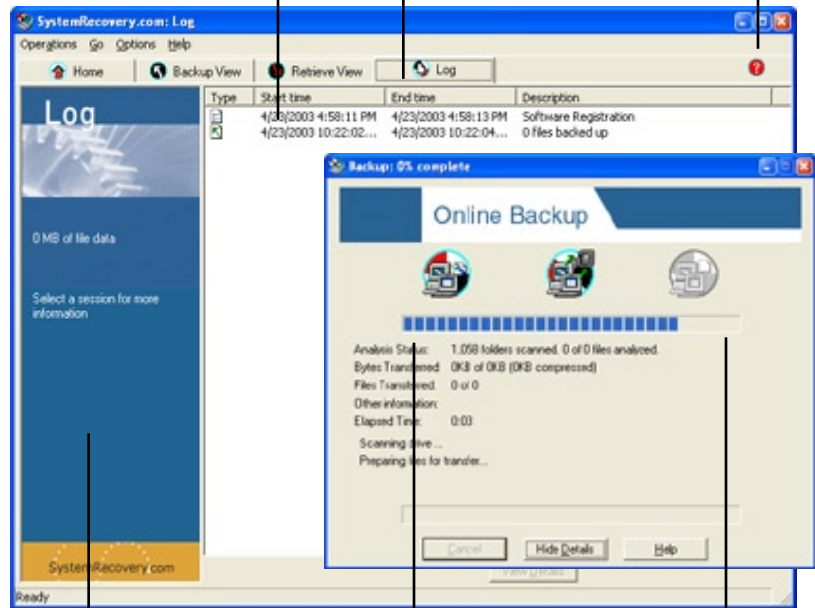

- **Common-File Elimination** increases the speed of backups by storing only one copy of files that have been distributed and saved by multiple users (e.g., the operating system and applications). This technology greatly reduces your backup times and makes even full system backups fast and easy.

- **Flat Rate Pricing** eliminates pricing guesswork. Pricing details and a 15-day FREE trial available at our website: www.systemrecovery.com

The familiar Windows interface, tabbed windows and a clean layout make for extremely user-friendly backup.

Detailed log entries describe the exact files that are stored at the backup data center.

“Localized Help” always displays help regarding the exact items you are using. No searching... no hassles.

“Block Differential Technology” means that only small portions of a changed file actually need to be backed up. Combined with data compression, this results in a backup size that is small enough to work well even over a slow dial-up connection.

“Common File Technology” removes the need to transmit files already sent to the data center. Most operating system and application program files will never need to be transmitted over the line. This makes full system backups feasible even over slow dial-up lines.

“Backup Restart Technology” you may stop or delay the backup at any time if you need to use your computer. When backup is resumed, System Recovery will continue to send any previously unsent files.

System Requirements

Computers Supported: Desktops, Laptops, Workstations, File Servers

Platforms: Windows XP, 2000, NT, Me, 98, 95

Internet Connection: DSL/cable/LAN or dial-up
