

How it works

- **Online Backup** scans the hard disk to identify the files that need to be backed up. The selected files form the “backup set”.
- **Common-File Technology** is applied to the “backup set” to identify files already stored on the server. These files remain in the “backup set” but do not need to be retransmitted to the server.
- **Block Differential Technology** is applied to files in the “backup set”. This technology determines the exact portions of a file that have changed. Only the changed portions need to be transmitted to the server.
- **Compression** - all backup data is compressed before it is sent to the data centers. This optimizes Internet transmission time, and uses less data storage space.
- **Encryption** converts the compressed “backup set” to an unreadable and completely safe format for transmission and storage over the Internet.
- **Transmission**, the final step, sends the optimized “backup set” to the offsite secure data center servers.

Free Trial

SystemRecovery.com offers a free 15-day trial of Online Backup. This is a risk-free, fully function version of our online backup software.

Online Backup Solutions

Online Backup

Block Differential Technology

Encryption

Data Protection Is Our Highest Priority!

Systems Supported - Desktop, Laptop, File Servers

Platforms - Window OS

Backup Timing - Backup scheduler allows you to schedule backups when it is convenient for you.

Safe and Secure - Rest assured that all data is transmitted, stored, and retrieved with the same encryption levels used by U.S. banks and the U.S. government.

Seamless - Online Backup provides an entire backup solution. There is no hardware needed, no hassles with tapes, and the chance of human error is eliminated.

Smart File Selection - Online Backup can automatically determines which files are non-essential, such as clip art or temporary internet files, and does not backup these files. This application feature saves backup time, helps maintain network efficiency, and reduces the size of your backup set and saves you money.

Multiplan pricing plans that fits your data protection needs. (Storage plans starting from 250MB to 20G)

Online Backup Features

- **Hassle-Free Backup** automatically starts whenever an internet connection is detected or at your predetermined time. This relieves you of the administrative burden of backup, and it can be performed nightly while you sleep. Manual backups are also fully supported.

- **Point-and-Click Restore** allows for simple, fast file recovery 24 hours a day, 365 days a year. Downtime in the event of loss, damage, or theft is minimal.

- **SystemRestore™ Technology** allows users to restore their system configuration to any date in the past 45 days. Available when you perform a full system backup, your machine can be restored to the exact same look-and-feel prior to a disaster, complete with all applications and data.

- **Block Differential** file comparison saves only the changed portions of files rather than the whole file. This can reduce the average backup session from hours to minutes and allows efficient dial-up operation.

- **Backup Restart Technology** you may stop or delay the backup at anytime if you need to use your computer. When resumed, the backup will continue to send any previously unsent files.

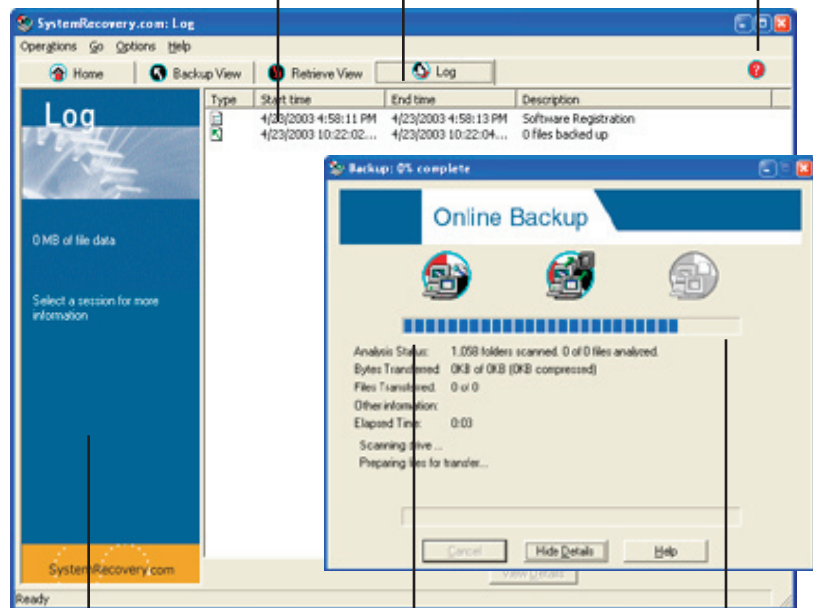

- **Common-File Technology** increases the speed of backups by storing only one copy of files that have been distributed and saved by multiple users (e.g., the operating system and applications). This technology greatly reduces your backup time and makes full system backup over dial-up connections feasible.

- **Flat Rate Pricing** eliminates pricing guesswork. Pricing details and a 15-day FREE trial available at: www.SystemRecovery.com

Detailed log entries describe the exact files that are stored at the backup data center.

Tabbed windows and a clean layout make usage a snap!

“Localized Help” always displays help regarding the exact items you are using. No searching... no hassle.

“Block Differential Technology” means that only small portions of a changed file actually need to be backed up. Combined with data compression, this results in a backup size that is small enough to work well over LAN and dial-up connections.

“Common File Technology” removes the need to transmit files that already exist on the server. Most operating system and application program files will never need to be transmitted over the line. This makes full system backups feasible over dial-up lines.

“Backup Restart Technology” you may stop or delay the backup at anytime if you need to use your computer. When resumed, the backup will continue to send any previously unsent files.

System Requirements

- Windows 95
- Windows 98
- Windows NT/2000
- LAN or Dial-up Connection
